</table>
In a 0.2 ml thin-walled PCR tube, mix the following:

- 1 µl DNA CS
- 47 µl DNA
- 3.5 µl NEBNext FFPE DNA Repair Buffer
- 2 µl NEBNext FFPE DNA Repair Mix
- 3.5 µl Ultra II End-prep reaction buffer
- 3 µl Ultra II End-prep enzyme mix

Mix gently by flicking the tube, and spin down.

Using a thermal cycler, incubate at 20°C for 5 minutes and 65°C for 5 mins.

**IMPORTANT**

**AMPure XP bead clean-up**

- Resuspend the AMPure XP beads by vortexing.
- Transfer the DNA sample to a clean 1.5 ml Eppendorf DNA LoBind tube.
- Add 60 µl of resuspended AMPure XP beads to the end-prep reaction and mix by flicking the tube.
- Incubate on a Hula mixer (rotator mixer) for 5 minutes at RT.
- Prepare 500 µl of fresh 70% ethanol in Nuclease-free water.
- Spin down the sample and pellet on a magnet. Keep the tube on the magnet, and pipette off the supernatant.
- Keep the tube on the magnet and wash the beads with 200 µl of freshly-prepared 70% ethanol without disturbing the pellet. Remove the ethanol using a pipette and discard.
- Repeat the previous step.
- Spin down and place the tube back on the magnet. Pipette off any residual ethanol. Allow to dry for ~30 seconds, but do not dry the pellet to the point of cracking.
- Remove the tube from the magnetic rack and resuspend the pellet in 61 µl Nuclease-free water. Incubate for 2 minutes at RT.
- Pellet the beads on a magnet until the eluate is clear and colourless.
- Remove and retain 61 µl of eluate into a clean 1.5 ml Eppendorf DNA LoBind tube.
- Quantify 1 µl of eluted sample using a Qubit fluorometer.

Take forward the repaired and end-prepped DNA into the adapter ligation step. However, at this point it is also possible to store the sample at 4°C overnight.

**Adapter ligation and clean-up**

**IMPORTANT**

- Although the recommended 3rd party ligase is supplied with its own buffer, the ligation efficiency of Adapter Mix (AMX) is higher when using Ligation Buffer supplied within the Ligation Sequencing Kit.
## INSTRUCTIONS

- Spin down Adapter Mix (AMX) and Quick T4 Ligase, and place on ice.
- Thaw Ligation Buffer (LNB) at RT, spin down and mix by pipetting. Due to viscosity, vortexing this buffer is ineffective. Place on ice immediately after thawing and mixing.
- Thaw the Elution Buffer (EB) at RT, mix by vortexing, spin down and place on ice.

### IMPORTANT

- Depending on the wash buffer (LFB or SFB) used in this section, the clean-up step after adapter ligation is designed to either enrich for DNA fragments of >3 kb, or purify all fragments equally.

- To enrich for DNA fragments of 3 kb or longer, thaw one tube of Long Fragment Buffer (LFB) at RT, mix by vortexing, spin down and place on ice.
- To retain DNA fragments of all sizes, thaw one tube of Short Fragment Buffer (SFB) at RT, mix by vortexing, spin down and place on ice.

In a 1.5 ml Eppendorf DNA LoBind tube, mix in the following order:

- 60 µl DNA sample from the previous step
- 25 µl Ligation Buffer (LNB)
- 10 µl NEBNext Quick T4 DNA Ligase
- 5 µl Adapter Mix (AMX)

Mix gently by flicking the tube, and spin down.

Incubate the reaction for 10 minutes at RT.

### IMPORTANT

- If you have omitted the AMPure purification step after DNA repair and end-prep, do not incubate the reaction for longer than 10 minutes.

- Resuspend the AMPure XP beads by vortexing.
- Add 40 µl of resuspended AMPure XP beads to the reaction and mix by flicking the tube.
- Incubate on a Hula mixer (rotator mixer) for 5 minutes at RT.
- Spin down the sample and pellet on a magnet. Keep the tube on the magnet, and pipette off the supernatant.
- Wash the beads by adding either 250 µl Long Fragment Buffer (LFB) or 250 µl Short Fragment Buffer (SFB). Flick the beads to resuspend, then return the tube to the magnetic rack and allow the beads to pellet. Remove the supernatant using a pipette and discard.
- Repeat the previous step.
- Spin down and place the tube back on the magnet. Pipette off any residual supernatant. Allow to dry for ~30 seconds, but do not dry the pellet to the point of cracking.
- Remove the tube from the magnetic rack and resuspend pellet in 15 µl Elution Buffer (EB). Incubate for 10 minutes at RT. For high molecular weight DNA, incubating at 37° C can improve the recovery of long fragments.
- Pellet the beads on a magnet until the eluate is clear and colourless.
Remove and retain 15 µl of eluate into a clean 1.5 ml Eppendorf DNA LoBind tube.

- Remove and retain the eluate which contains the DNA library in a clean 1.5 ml Eppendorf DNA LoBind tube
- Dispose of the pelleted beads
- Quantify 1 µl of eluted sample using a Qubit fluorometer.

The prepared library is used for loading into the flow cell. Store the library on ice until ready to load.

**IMPORTANT**

- We recommend loading 5–50 fmol of this final prepared library onto R9.4.1 flow cells or 25-75 fmol onto R10.3 flow cells.

### Priming and loading the SpotON flow cell

**IMPORTANT**

- Please note that the Sequencing Tether (SQT) tube will NOT be used in this protocol. It is provided in the kit for potential future product compatibility.

- Thaw the Sequencing Buffer (SQB), Loading Beads (LB), Flush Tether (FLT) and one tube of Flush Buffer (FB) at RT before placing the tubes on ice as soon as thawing is complete.

- Mix the Sequencing Buffer (SQB), Flush Buffer (FB) and Flush Tether (FLT) tubes by vortexing, spin down then return to ice.

- Open the MinION Mk 1B lid and slide the flow cell under the clip.

- Slide the priming port cover clockwise to open the priming port.

**How to prime and load the SpotON Flow Cell**

**IMPORTANT**

- Take care when drawing back buffer from the flow cell. Do not remove more than 20-30 µl, and make sure that the array of pores is covered by buffer at all times. Introducing air bubbles into the array can irreversibly damage pores.

After opening the priming port, check for a small air bubble under the cover. Draw back a small volume to remove any bubbles (a few µl):

- Set a P1000 pipette to 200 µl
- Insert the tip into the priming port
- Turn the wheel until the dial shows 220-230 µl, or until you can see a small volume of buffer entering the pipette tip

- Prepare the flow cell priming mix: add 30 µl of thawed and mixed Flush Tether (FLT) directly to the tube of thawed and mixed Flush Buffer (FB), and mix by vortexing.

- Load 800 µl of the priming mix into the flow cell via the priming port, avoiding the introduction of air bubbles. Wait for 5 minutes. During this time, prepare the library for loading by following the steps below.

- Thoroughly mix the contents of the Loading Beads (LB) by pipetting.
**INSTRUCTIONS**

<table>
<thead>
<tr>
<th>IMPORTANT</th>
<th>NOTES/OBSERVATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>□ The Loading Beads (LB) tube contains a suspension of beads. These beads settle very quickly. It is vital that they are mixed immediately before use.</td>
<td></td>
</tr>
</tbody>
</table>

In a new tube, prepare the library for loading as follows:

- □ 37.5 µl Sequencing Buffer (SQB)
- □ 25.5 µl Loading Beads (LB), mixed immediately before use
- □ 12 µl DNA library

Complete the flow cell priming:

- □ Gently lift the SpotON sample port cover to make the SpotON sample port accessible.
- □ Load 200 µl of the priming mix into the flow cell via the priming port (not the SpotON sample port), avoiding the introduction of air bubbles.
- □ Mix the prepared library gently by pipetting up and down just prior to loading.
- □ Add 75 µl of sample to the flow cell via the SpotON sample port in a dropwise fashion. Ensure each drop flows into the port before adding the next.
- □ Gently replace the SpotON sample port cover, making sure the bung enters the SpotON port, close the priming port and replace the MinION Mk 1B lid.

**Ending the experiment**

- □ After your sequencing experiment is complete, if you would like to reuse the flow cell, please follow the Wash Kit instructions and store the washed flow cell at 2-8 °C, OR
- □ Follow the returns procedure by washing out the flow cell ready to send back to Oxford Nanopore.

**IMPORTANT**

- □ If you encounter issues or have questions about your sequencing experiment, please refer to the Troubleshooting Guide that can be found in the online version of this protocol.
